Inflation: Sometimes it skips a generation

Thoughts on inflation during a Federal Open Market Committee (FOMC) meeting week

In our view, the threat of a sharp climb in U.S. inflation shouldn't be at the forefront of investor worries at this time. However, the drivers of inflation and their influence on near- and longer-term interest rates are important to understand to help best choose investments and build a portfolio.

We list some interesting aspects of U.S. inflation history and why we think inflation will stay near the U.S. Federal Reserve's (the Fed's) 2% target for the next few years despite a further decline in U.S. unemployment rates.

1) Low inflation is the U.S. norm. Since 1800, the average U.S. inflation rate is 1.4%. Outside of wars, U.S. inflation is 0.5% on average. Outside of wars and 1971-1982, the average is 0.0%.

2) Though short-term deviations can occur, inflation over the long term is largely under the control of monetary policy. By setting an inflation target, central banks aim to anchor people's expectations around that target and build that into their wage- and price-setting behavior and investment planning. If successful, that alone can go a long way to keeping inflation near target. Fed policymakers also adjust financial conditions in response to short-term cyclical movements in the economy, aiming not only to keep inflation near target, but also to meet the other part of their mandate, full employment.

3) In the 1800s, before the Fed, there were periods of productivity surges from agricultural advancements and industrialization causing episodes of supply-boom-driven deflation. Deflation can be damaging to an economy, because any price instability interferes with the effectiveness of price signals, crucial to market-based economies, business planning and contracts.

4) Central banks generally desire low but positive and stable inflation rates. Stable, so that it doesn't interfere with people's planning; positive so that it provides a buffer against deflation and affords central banks more room to cut real interest rates in response to economic downturns without bumping up against the effective lower bound on nominal interest rates. The Fed's current inflation target (for the price index for personal consumption expenditures) is 2%.

5) It's normal for the economic cycle to cause temporary deviations in inflation from the Fed's target. But such deviations are generally moderate and are rarely sudden jumps or plunges of several percentage points with the exception of inflationary jumps upon wars and plunges upon sharp recessions. In recent cycles, the Fed has been quite successful in preventing inflation from veering

too far from target, in part because inflation expectations have remained firmly anchored.

6) Persistent deviation from an inflation target would represent ineffective monetary policy. Generally, supply-side-shock-driven inflation – say, due to an energy-supply disruption - shouldn't be met with tighter monetary policy provided inflation expectations are not dislodged, making it unlikely that any sharp movement in inflation caused by that shock will persist.

7) An important part of the inflation process is unit labor costs. While oil is in a lot of things, labor is in everything. But realize that wage growth is not inflationary if fueled by rising productivity. Productivity-driven wage growth is prosperity.

8) If employers increase wages more than productivity justifies, they would need to pass the cost forward to customers as price hikes to maintain profits. This is difficult in a competitive economy. If such a wage-price spiral did take hold, as it did in the 1970s, it's unlikely that the Fed would tolerate such price instability. That alone makes it less likely that such a spiral would develop.

9) In the past 30 years, the highest monthly inflation spike was 6.3% in 1990. Anyone born after January 1983 hasn't experienced double-digit inflation in the U.S.

10) If inflation stays close to the Fed's target, as we expect, we don't think the Fed will "slam on the brakes" – i.e. adopt a sharply restrictive monetary policy. We do expect them to keep raising interest rates and shrinking their balance sheet into next year, but moderately, enough to move policy to a more neutral, or at most slightly restrictive stance, with the aim to bring the economy in for a "soft landing" – to cool activity enough to keep the labor market from overheating, but not enough to derail the expansion. Historically, that has been hard to do. And exactly how high the federal funds rate needs to go to achieve that is uncertain, but we suspect it's not likely to be much more than 3%.

Glossary

Deflation

Deflation is a sustained decrease in the general price level of goods and services.

Federal funds rate

The **federal funds rate** is the interest rate, set by the Fed, at which banks lend money to each other, usually on an overnight basis.

Inflation

Inflation is the rate at which the general level of prices for goods and services is rising and, subsequently, purchasing power is falling.

Recession

A recession is, technically, when an economy contracts for two successive quarters but is often used in a looser way to indicate declining output.

U.S. Federal Reserve Board (the Fed)

The **U.S. Federal Reserve Board**, often referred to as "**the Fed**", is the central bank of the United States.

Unit labor costs

Unit labor costs (ULC) measure the average cost of labor per unit of output.

Risk warning

Investments are subject to investment risk, including market fluctuations, regulatory change, possible delays in repayment and loss of income and principal invested. The value of investments can fall as well as rise and you might not get back the amount originally invested at any point in time.

Investments in Foreign Countries – Such investments may be in countries that prove to be politically or economically unstable. Furthermore, in the case of investments in foreign securities or other assets, any fluctuations in currency exchange rates will affect the value of the investments and any restrictions imposed to prevent capital flight may make it difficult or impossible to exchange or repatriate foreign currency.

Foreign Exchange/Currency – Such transactions involve multiple risks, including currency risk and settlement risk. Economic or financial instability, lack of timely or reliable financial information or unfavorable political or legal developments may substantially and permanently alter the conditions, terms, marketability or price of a foreign currency. Profits and losses in transactions in foreign exchange will also be affected by fluctuations in currency where there is a need to convert the product's denomination(s) to another currency. Time zone differences may cause several hours to elapse between a payment being made in one currency and an offsetting payment in another currency. Relevant movements in currencies during the settlement period may seriously erode potential profits or significantly increase any losses.

High Yield Fixed Income Securities – Investing in high yield bonds, which tend to be more volatile than investment grade fixed income securities, is speculative. These bonds are affected by interest rate changes and the creditworthiness of the issuers, and investing in high yield bonds poses additional credit risk, as well as greater risk of default.

Hedge Funds – An investment in hedge funds is speculative and involves a high degree of risk, and is suitable only for “Qualified Purchasers” as defined by the US Investment Company Act of 1940 and “Accredited Investors” as defined in Regulation D of the 1933 Securities Act. No assurance can be given that a hedge fund's investment objective will be achieved, or that investors will receive a return of all or part of their investment.

Commodities – The risk of loss in trading commodities can be substantial. The price of commodities (e.g., raw industrial materials such as gold, copper and aluminium) may be subject to substantial fluctuations over short periods of time and may be affected by unpredicted international monetary and political policies. Additionally, valuations of commodities may be susceptible to such adverse global economic, political or regulatory developments. Prospective investors must independently assess the appropriateness of an investment in commodities in light of their own financial condition and objectives. Not all affiliates

or subsidiaries of Deutsche Bank Group offer commodities or commodities-related products and services.

Investment in private equity funds is speculative and involves significant risks including illiquidity, heightened potential for loss and lack of transparency. The environment for private equity investments is increasingly volatile and competitive, and an investor should only invest in the fund if the investor can withstand a total loss. In light of the fact that there are restrictions on withdrawals, transfers and redemptions, and the Funds are not registered under the securities laws of any jurisdictions, an investment in the funds will be illiquid. Investors should be prepared to bear the financial risks of their investments for an indefinite period of time.

Investment in real estate may be or become nonperforming after acquisition for a wide variety of reasons. Nonperforming real estate investment may require substantial workout negotiations and/ or restructuring.

Environmental liabilities may pose a risk such that the owner or operator of real property may become liable for the costs of removal or remediation of certain hazardous substances released on, about, under, or in its property. Additionally, to the extent real estate investments are made in foreign countries, such countries may prove to be politically or economically unstable. Finally, exposure to fluctuations in currency exchange rates may affect the value of a real estate investment.

Structured solutions are not suitable for all investors due to potential illiquidity, optionality, time to redemption, and the payoff profile of the strategy. We or our affiliates or persons associated with us or such affiliates may: maintain a long or short position in securities referred to herein, or in related futures or options, purchase or sell, make a market in, or engage in any other transaction involving such securities, and earn brokerage or other compensation. Calculations of returns on the instruments may be linked to a referenced index or interest rate. In such cases, the investments may not be suitable for persons unfamiliar with such index or interest rates, or unwilling or unable to bear the risks associated with the transaction. Products denominated in a currency, other than the investor's home currency, will be subject to changes in exchange rates, which may have an adverse effect on the value, price or income return of the products. These products may not be readily realizable investments and are not traded on any regulated market.
