U.S. Chief Economist

In a nutshell

- Mixed signals and powerful crosscurrents are clouding the picture, making it hard to discern underlying trends in the U.S. economy.
- Sifting through the fog, though, it seems that momentum has crested, and the economy appears to have downshifted to a more moderate pace, roughly as we expected, reflecting the effects of a waning fiscal stimulus, tighter financial conditions, trade restrictions, and a weaker growth profile abroad.
- A bit more hiking from the Fed may eventually be needed to nudge the economy onto a more sustainable path, but just a little, and nothing until the second half of the year at the earliest.
- We still see the overall macroeconomic backdrop as broadly supportive of risk assets.

U.S. economic outlook

Economic, monetary and financial market outlook

Economic outlook

Mixed signals and powerful crosscurrents are clouding the picture, making it hard to discern underlying trends in the U.S. economy. The data have been sending conflicting messages, with some indicators suggesting momentum is unbowed, while others hint at sharp deceleration and most fall somewhere in between. Delays in the data flow resulting from the (now ended) government shutdown further complicate interpretations, while adverse weather, residual seasonality in some data series, and the effects of the shutdown itself may add to the confusion and temporarily weigh on measured activity early in the year. As if that were not enough, financial conditions have swung wildly, tightening sharply in the fourth quarter but reversing course so far this year, while unresolved trade tensions and a weaker, more uncertain backdrop abroad raise still more questions about the U.S. outlook.

In short, the fog is particularly thick right now. Sifting through it, though, a few outlines can be gleaned, if faintly. Momentum has likely crested, and the economy seems to have downshifted to a more moderate pace, reflecting the effects of waning fiscal stimulus, tighter financial conditions, trade restrictions, and a weaker growth profile abroad. But the deceleration does not seem excessive, nor is it surprising or undesirable; we have long felt that these restraining forces would edge the U.S. economy onto a more moderate trajectory, and that such a moderation would actually be welcome, making it less likely that the kinds of excesses and imbalances that have felled past expansions – inflationary overheating¹ and/or private-sector overindulgence – would emerge. That the economy is still largely devoid of these "expansion killers" increases the chances this one can continue.

But it is hardly a sure thing; "soft landings"² – where the economy glides onto a more sustainable path, curtailing potentially destabilizing excesses without jeopardizing the expansion – are never easy to pull off. And during the descent phase, passengers can feel a bit queasy, especially if the economy encounters any air pockets or risk factors – of which there are plenty right now.

Trade tensions are one. The trade restrictions enacted so far, together with those potentially in the pipeline, have likely taken some toll on activity already, in part by increasing uncertainty, weighing on investment plans, and contributing to a tightening of financial conditions. Much focus has been on the U.S.-China tiff, but restrictions have been enacted on other fronts too, with risks of more to come (on European autos, for example), and even the renegotiated North American Free Trade Agreement (NAFTA) deal is not assured of legislative approval (though it remains likely). Trade conflict is especially inopportune when global activity is already wobbly; momentum in Europe remains sluggish, and uncertainty is rife in China, where trade tensions are exacerbating homegrown strains. All told, global drags could wash up a bit more powerfully onto U.S. shores than we had envisioned. On the plus side, though, partial resolution of U.S.-China trade conflict may be in the offing – enough to forestall any further tariffs and possibly reverse some of the restrictions already enacted. Though it will not likely resolve all areas of contention between the United States and China, an agreement would reduce risks of an escalating trade war.

Closer to home, the end of the government shutdown removes another source of uncertainty. Still, it will take a while for the data backlog to clear, and for the (mild) macroeconomic drag from the shutdown to dissipate. The shutdown however may be symptomatic of a broader political dysfunction that raises questions about how the government will handle issues like raising the debt ceiling³, which will need to be done later this year.

And then there are developments in financial markets. In the fourth quarter of last year, heightened volatility, sharp declines in equity and commodity prices, wider credit spreads, and lower interest rates on government securities suggested that markets had not only downgraded their base-case expectations for economic growth, but increased their assessment of downside risks and the compensation they require for bearing those risks – not just in

³The United States debt ceiling or debt limit is a legislative limit on the amount of national debt that can be incurred. This puts a ceiling on the amount of money the federal government may borrow.

the United States, but around the world. This year, a completely different narrative seems to have taken hold, with sentiment reversing sharply (albeit not quite completely).

What to make of these wild swings? On balance, U.S. financial conditions have tightened modestly over the past year, enough to take away some impetus from activity, but hardly enough on its own to derail things – especially since many of other economic drivers remain broadly supportive.

Most encouragingly, the private sector still seems largely devoid of the kinds of large-scale excesses and imbalances that precipitated recessions in the past. Chastened by the crisis, households and businesses, borrowers and lenders, savers and spenders (and regulators) have been much more cautious this time. The private sector is not over its skis. The economy also seems less vulnerable to the inflationary overheating that brought on recessions in past cycles – in part by provoking aggressive tightening by the U.S. Federal Reserve (Fed). Yes, labor markets are tight and wage pressures have been building. But recent indications suggest that the labor market may have a bit more running room – or at least may not be tightening far beyond full employment, as some had feared. Moreover, labor costs continue to pick up only modestly, to levels consistent with, but not threatening to breach the Fed's inflation target. Well-anchored inflation expectations, a more attenuated responsiveness of inflation to slack, and temporary restraint from the stronger U.S. dollar (USD) and declines in commodity prices should also help prevent a material inflation overshoot, and enable the Fed to tread carefully, avoiding the over-tightening that often doomed past expansions.

All told, we think markets got overwrought late last year about the economic outlook. We still see activity downshifting, but do not see a recession in the near-term cards. On the contrary, this expansion is apt to persist, becoming the longest ever by this summer, and continuing even beyond that. In fact, if some of the near-term risks dissipate – trade, global weakness, and tightening financial conditions – the economy may even regain some strength, at least temporarily perhaps this spring and summer.

In short, though soft landings are rare, they have happened before, and for the reasons outlined above, the United States seems to have better odds of achieving one this time. Still, it is going to a tough needle to thread. And risks have risen.

Monetary-policy outlook

"Patience" is the operative word for Fed policymakers right now. Against an increasingly cloudy backdrop, with signs of slowing and downside risks, with inflation seemingly in little danger of material overshoot, and with a growing recognition that they have already chopped a lot of wood – raising the federal funds rate a cumulative 225 basis points (bps), and setting the balance sheet on a path of decline – policymakers see the prudent course as "wait-and-see." On hold for now, await greater clarity on how recent developments – financial conditions, trade negotiations, global activity, mixed messages in US data – evolve and shape the outlook.

We still think a bit more hiking from the Fed may eventually be needed to nudge the economy onto a more sustainable path, but just a little (perhaps one or at most two hikes over the next 12 months or so), and nothing until the second half of the year at the earliest. And the hurdle for even that is pretty high, likely requiring clear evidence that the downside risks have diminished, labor markets have resumed tightening, and inflation is at least at target. Of course, where policy actually goes will depend on how the outlook evolves, but the range of plausible outcomes is wider than it has been in recent years, because the outlook is cloudier and policy no longer so clearly accommodative and in need of adjustment.

The federal funds rate will remain the primary lever used to adjust the stance of policy – the balance sheet a more secondary tool. Barring outsized shocks to the outlook, the ultimate size of the balance sheet will be dictated largely by technical considerations – in particular, when reserves are lower than they are now but still "ample" – more than enough to enable the Fed to control short-term interest rates by adjusting administered rates (like interest on reserves). Though there is uncertainty about just what that optimal level of reserves[#] may be, and when it might be reached, we continue to expect it to be sometime between late 2019 and spring 2020, by when the cumulative reduction of Fed security holdings will reach between 800 billion USD and 1 trillion USD (it is 400 billion USD through January 2019). Policymakers may opt to slow the pace of runoff as the end approaches, to get more clarity on just where optimal reserve levels may lie. After the runoff, mortgage-backed security (MBS) holdings will likely continue to dwindle (replaced by Treasuries), and the Fed may shift toward a somewhat shorter duration of Treasury holdings. But barring a renewed shock, the balance sheet will not likely be used as an active tool of policy.

Financial market outlook

Financial markets have been on a wild roller coaster in recent months. Late last year anxiety increased sharply as markets worried about slowing global growth, trade tensions, political dysfunction, perceptions of overly aggressive monetary policy, and how difficult it will be for the United States to sustain its recent cyclical sweet spot. More recently, many of these fears have receded, and sentiment has recovered, albeit still not quite completely.

It is understandable why people got more cautious. There is no shortage of things to worry about on the global front, and closer to home we have long worried that markets might come to doubt the sustainability of the good news for the U.S. economic cycle. The longer growth stayed above potential, the tighter labor markets became, and the more the Fed hiked, the greater the risk that investors might turn persistently more cautious, increasingly aware that the most favorable phase of the economic cycle for financial assets may be behind us. But we think the worries late last year got overdone. We still see the overall macroeconomic backdrop – no recession on the horizon, no material inflation overshoot, and a moderation to a more sustainable pace that enables the Fed to slow down – as broadly supportive of risk assets.
